

To install the XAware Designer 5.0 plug-in into ActiveVOS Designer a few quick steps are required. The steps are described here. These steps assume you have installed ActiveVOS Designer already.

1. In the Update Manager (Help | Software Updates | Find and Install), select Search for new features to install and click Next.

Note: Some update sites are listed by default (like Callisto Discovery), and you will add the XAware update site to this list.

2. Click New Remote Site.
3. In the New Update Site dialog, type a name and the XAware Update Site URL from the page at the link below and click OK.

<http://www.xaware.org/content/view/72/513/>

4. Check the boxes for Callisto and Eclipse update sites.
5. Click Finish to move to the next screen.

The list of available XAware updates appears. When you select the version of the XAware Designer plug-in you want to install, you may see an error noting an install dependency. This is because the XAware Designer plug-in requires WST version 1.5x. If this occurs, do these steps:

- a. First expand all the top-level sites and click the "Select Required" button. The error message should go away.
 - b. If the first step doesn't get rid of the error, you can install WST from the Callisto Discovery Site in the Web and J2EE Development category.
 - c. If the previous step doesn't work, you may need to unselect the Show the latest version of a feature only checkbox and select the Graphical Editors and Frameworks option. After that, click "Select Required" again and the error message should go away. If it does not, then try expanding the Eclipse Project Updates list and click "Select Required" again and the error message should go away.
6. After this, you should be able to proceed with the update as usual.
